BUSINESS INTELLIGENCE REPORT

Executive overview

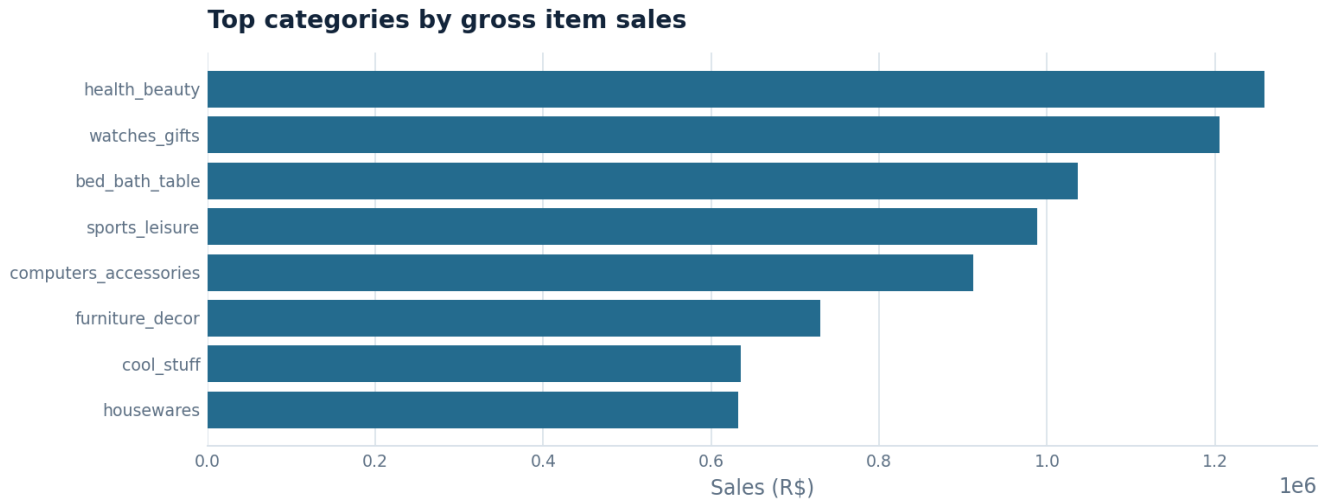

Brazilian E-Commerce (Olist) dataset | Generated 16 Oct 2026, 11:30 IST | Data through 17 Oct 2018

GROSS ITEM SALES	UNIQUE CUSTOMERS	AVERAGE ORDER VALUE	REPEAT-CUSTOMER RATE
R$ 13,591,644	96,096	R$ 137.75	3.12%

Sales trend

Category performance

Evidence-linked findings

Year-over-year sales momentum

Sales performance - Positive signal

Reliable monthly item sales are growing year over year.

Evidence

- August 2018: R$ 854,686.33 gross item sales across 6,512 orders.
- Change from the same month one year earlier: +48.9%.
- Comparison uses months with at least 500 placed orders; data cutoff: 17 Oct 2018.

Suggested action: Check stock availability and delivery capacity for the latest high-performing categories before increasing promotion spend.

Limitation: Historical item sales exclude freight and do not explain why sales changed. The dataset is not live.

Top three categories account for 25.8% of item sales

Product mix - Portfolio view

The three highest-grossing categories account for 25.8% of observed item sales.

Evidence

- Leading categories: health_beauty, watches_gifts, bed_bath_table.
- health_beauty: R$ 1,258,681.34 (9.3% of category sales).
- watches_gifts: R$ 1,205,005.68 (8.9% of category sales).
- bed_bath_table: R$ 1,036,988.68 (7.6% of category sales).

Suggested action: Review inventory and service readiness for the largest categories while checking whether smaller categories have room to grow.

Limitation: Sales share is not profit share; margins, stock availability, advertising spend, and product returns are not included in this comparison.

Review the historical at-risk customer group

Customer behavior - Needs attention

15,003 customers (15.6% of the base) fall into the relative RFM At risk segment and account for 30.7% of observed item sales.

Evidence

- All-time repeat-customer rate: 3.12% of unique customers with more than one order.
- At-risk segment mean item spend: R$ 277.81 per customer.
- Champions: 994 customers and 2.4% of item sales.
- RFM reference date: 17 Oct 2018.

Suggested action: Use a small re-engagement experiment with a holdout group, then compare incremental repeat purchases and contribution margin before scaling.

Limitation: RFM groups are relative to this historical dataset cutoff. They do not identify customers who are currently at risk or establish that a campaign will work.

High-volume categories with weaker review scores

Product experience - Needs attention

1 category/categories meet the review and sales screening rule; the weighted dataset baseline is 4.10/5.

Evidence

- office_furniture: 3.62/5 across 1,263 reviewed orders, with R$ 273,960.70 in item sales.

Suggested action: Read the underlying review comments and inspect products in these categories to identify recurring quality, listing, or fulfillment issues.

Limitation: Reviews are order-level. In orders with multiple categories, a review cannot be attributed to a specific product.

High-volume markets with slower delivery

Fulfillment - Needs attention

6 markets exceed the order-weighted delivery baseline by more than 15% while meeting the volume screening rule.

Evidence

- Delivered-order weighted baseline: 12.56 days.
- BA: 19.34 days across 3,256 delivered orders; 3.8% of item sales.
- ES: 15.79 days across 1,995 delivered orders; 2.0% of item sales.
- GO: 15.61 days across 1,957 delivered orders; 2.2% of item sales.
- RJ: 15.31 days across 12,350 delivered orders; 13.4% of item sales.
- RS: 15.30 days across 5,344 delivered orders; 5.5% of item sales.

Suggested action: Compare seller origin, route distance, and order hand-off timelines in these markets before changing carrier or service policies.

Limitation: This historical association does not control for distance, product mix, or customer expectations and is not a current service-level measure.

Definitions and interpretation

Gross item sales sum product item prices and exclude freight. Average order value uses item sales for orders with items. Repeat-customer rate counts people with more than one recorded order.

Sales comparisons use complete-enough months with at least 500 orders. Customer groups are relative RFM segments anchored to the dataset cutoff. Delivery comparisons use delivered-order weighted averages. These historical associations are descriptive and do not establish causation or predict current performance.
